$\Omega \sim r^{-2}$ (conservation of angular momentum)

Distance Measurement

- Light echo

$$D = c \Delta t$$

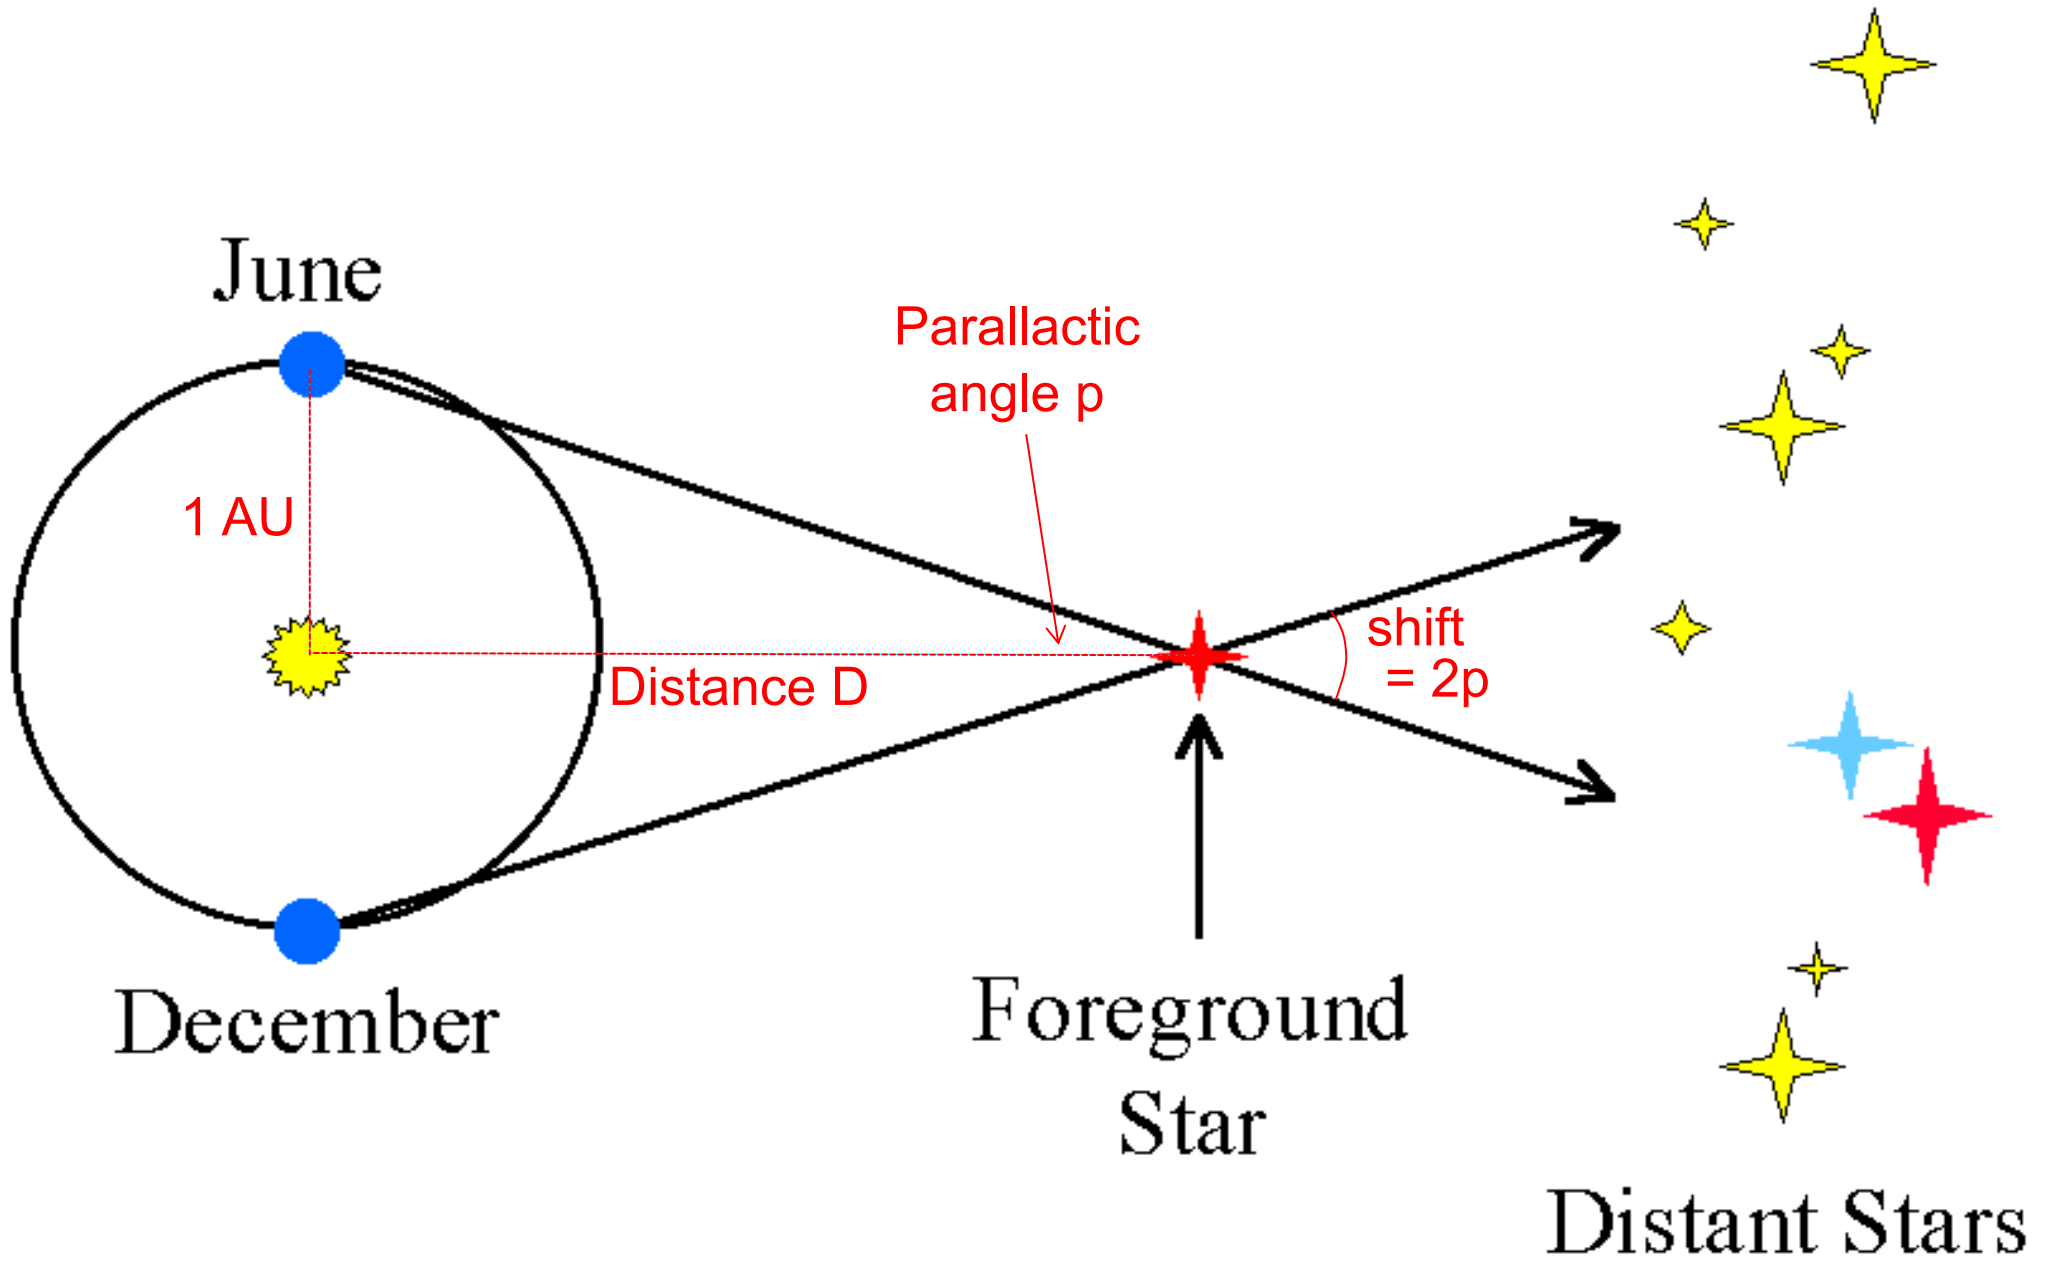

- Standard ruler

$$D = L / \theta$$

Parallax

Parallax

Parallax

$$p \text{ (radians)} = 1 \text{ AU} / D$$

$$D = 1 \text{ AU} / p \text{ (radians)}$$

if $p = 1 \text{ arcsec} = 4.8 \times 10^{-6} \text{ radians}$,
then $D = 206,000 \text{ AU} = 1 \text{ parsec}$

Parallax

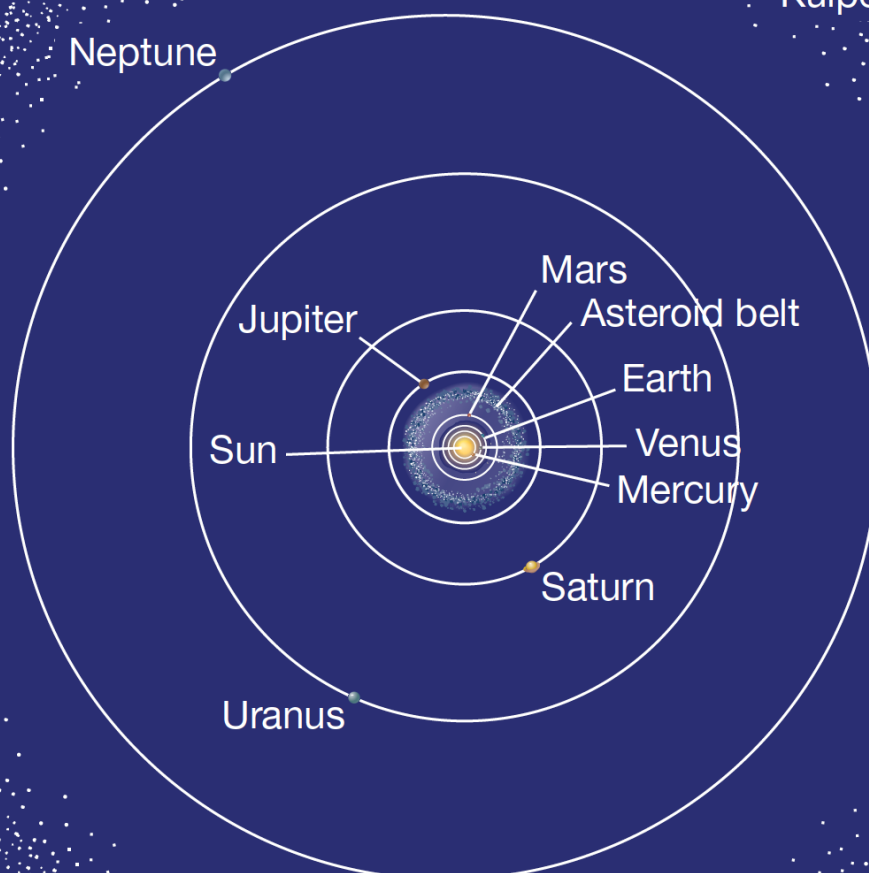

$$p \text{ (radians)} = 1 \text{ AU} / D$$

$$D = 1 \text{ AU} / p \text{ (radians)}$$

$$D \text{ (parsec)} = 1 / p \text{ (arcsec)}$$

100 AU = 1.5×10^{11} m

Kuiper belt

Neptune

Mars
Asteroid belt
Earth
Venus
Mercury

Uranus
Jupiter
Sun

1 AU = 1.5×10^{11} m

A star field with a bright blue-white star in the center and several orange-red stars. The background is filled with many smaller, fainter stars of various colors.

Alpha Centauri

parallax = 0.747 arcsec
distance = 1.34 parsec
= 4.1×10^{16} m
= 4.4 light years
= 276,000 AU

Centauri C

Distance Measurement

- Light echo

$$D = c \Delta t$$

- Standard ruler

$$D = L / \theta$$

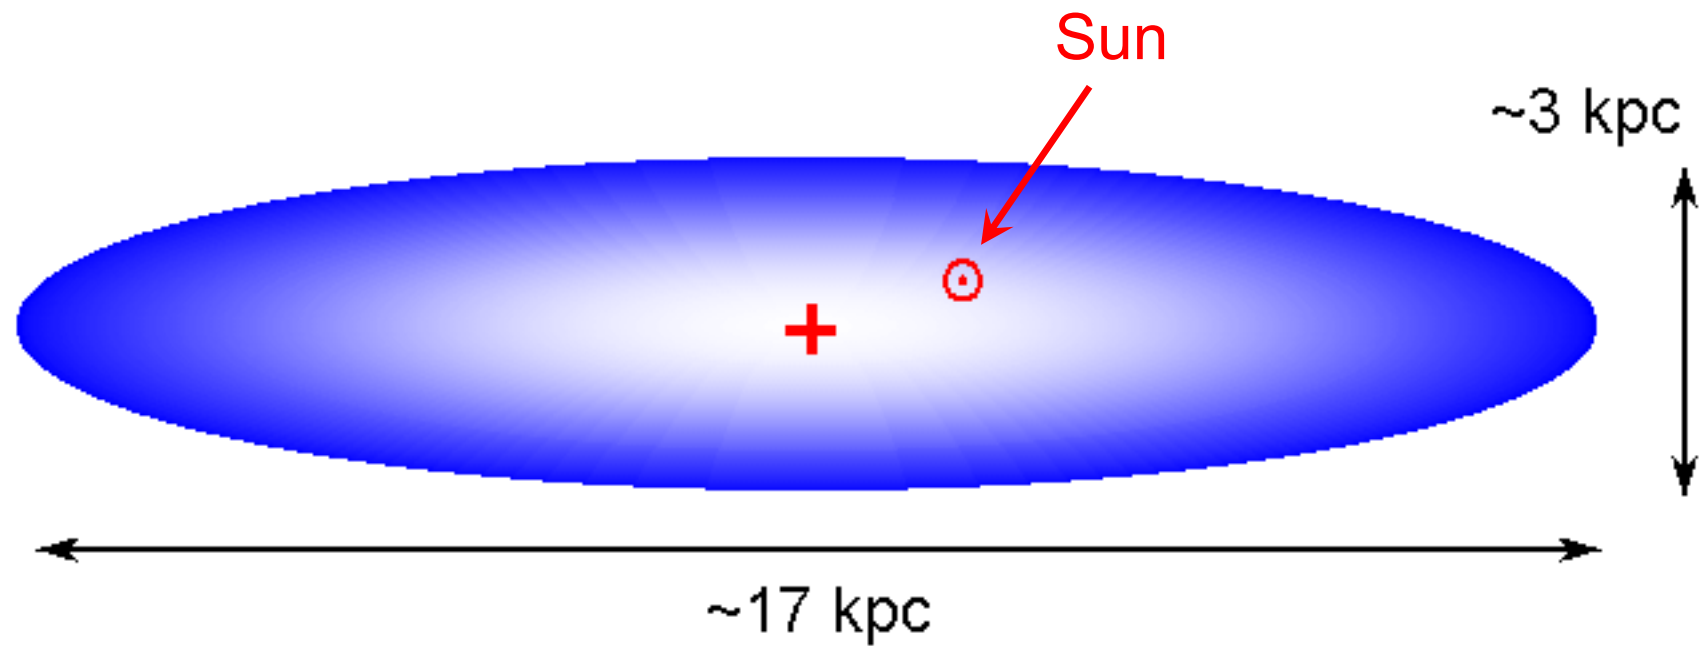

- Standard candle

$$D = \sqrt{\frac{L}{4\pi f}}$$

Herschel model (1785)

Kapteyn Model (1922)

M68

distance ~ 10 kpc
diameter ~ 30 pc

47 Tucanae

distance ~ 4 kpc
diameter ~ 40 pc

Distance Measurement

- Light echo

$$D = c \Delta t$$

- Standard ruler

$$D = L / \theta$$

- Standard candle

$$D = \sqrt{\frac{L}{4\pi f}}$$

- Hubble expansion

$$D = \Delta v / H_0$$
